

Adult Type 2 Diabetes - Glycemic Targets (clinic reference)

Ridgecrest Community Health Center - shared by F. Warner, MD. Scanned copy. Standards of Care summary, current edition.

GLYCEMIC TARGETS FOR MOST NON-PREGNANT ADULTS

A1C goal: less than 7.0%

Fasting / pre-meal: 80 to 130 mg/dL

Post-meal (1 to 2 hr): less than 180 mg/dL

Individualize targets. A less stringent A1C (for example under 8.0%) may be appropriate for older adults, those with limited life expectancy, advanced complications, or a history of severe hypoglycemia. For most adults, the general goal remains less than 7.0%.

Patient-education materials shared with the community should state the general less-than-7.0% goal and direct readers to their own clinician for a personal target.
